Teaching Case

Ding Dong, You've Got Mail! A Lab Activity for Teaching the Internet of Things

Mark Frydenburg mfrydenberg@bentley.edu Computer Information Systems Department Bentley University Waltham, MA 02452, USA

Abstract

Connecting ordinary devices to the Internet is a defining characteristic of the Internet of Things. In this hands-on lab activity, students will connect a wireless doorbell to the Internet using a Raspberry Pi computer. By modifying and running a program on the Raspberry Pi to send an email or text message notifying a recipient that someone is at the door, students will gain an appreciation for how the Internet of Things enables devices to work together to produce new products or solutions. The activity also serves as a brief introduction to interacting with the Linux operating system on a Raspberry Pi computer. Working in groups of 3 or 4, students will demonstrate their understanding by completing a collaborative lab report that summarizes the key takeaways of each step. Little or no programming skills are required. The experience of physically connecting an everyday object to a device online gives an appreciation of the potential for automating tasks using the Internet of Things.

Keywords: Internet of Things, Raspberry Pi, Python, programming, automation.

1. INTRODUCTION

The Internet of Things continues to become apparent in daily life as the number of everyday items connected to the Internet constantly increases. Sensors, wearable and mobile devices, and apps capable of transmitting, receiving, and modifying data over the Internet allow for new possibilities and business opportunities.

This lab activity is based on a blog post by Martin Harizanov. (Harizanov, 2013) This lab guide describes how connect a wireless doorbell to the Internet using a Raspberry Pi computer. Upon pressing the doorbell's buzzer, a program running on the Raspberry Pi will send an email or text message to the recipient's computer or mobile device notifying that someone is at the door. You will reach several milestones as you work through the steps involved:

 Create a lab report as a Google Doc and share it with your group and instructor

ISSN: 2473-3857

- Identify all of the equipment needed
- Wire the doorbell to the Raspberry Pi
- Connect the keyboard, mouse, camera, Ethernet cable, and display to the Raspberry Pi, and power it on
- Test the camera to make sure it takes pictures and identify the location where they are stored
- Create a folder to store, and examine the source code for the programs that wait for the doorbell to be pressed, and then send the notifications
- Run a program to test the connection between the doorbell and the Raspberry Pi
- Modify and test the program to take a picture and send an email message
- Modify the program to send a text message

You will work in groups of 3 or 4 to complete this assignment. Discuss the **For Your Lab Report** questions with your group as you complete each step, and take turns recording your answers in a lab report document that you create as a Google Doc. Except for the last two questions, which ask you to reflect on your own personal experience with this activity, your group will receive the same grade for your lab report. Each group member is responsible to ensure that the lab report shows your group's answers to all of the questions.

Learning Objectives

After completing this activity, you will be able to:

- Explain ideas related to the Internet of Things
- Identify the components and ports of a Raspberry Pi Computer
- Describe how a Raspberry Pi computer can receive data from an external object
- Recognize and modify simple code statements in Python
- Navigate to files and folders, and run programs in the Linux operating system using both graphical and command line interfaces
- Describe how a program can automate common tasks

Preparing for the Lab Activity

Complete these steps before working on this activity:

- Read this description before coming to class on the day we will complete it, so that you will be familiar with the steps. That will save you a lot of time.
- Identify the three other people who are in your group.
- Create a Google Doc containing the blank lab report template for this assignment. (You can find this document at http://bit.ly/doorbellreport. Share it with your group members and with your instructor at the email provided.

2. GETTING STARTED

Examine the kit containing the equipment for this lab activity. Make sure it contains all of these items, shown in Appendix 1, Figure 1:

- Raspberry Pi with camera installed (or USB webcam)
- Power supply with micro-USB cable

- Ethernet cable
- Wireless doorbell and buzzer with batteries installed

ISSN: 2473-3857

- 1 220-ohm resistor
- 3 clip lead wires (two of the same color for positive, and one of a different color for ground)
- 2 jumper wires already connected to Raspberry Pi pins

In addition, you will need:

- An HDMI display and cable
- A USB keyboard and mouse
- A Gmail address and password so your Raspberry Pi can send email (provided by your instructor)
- A personal Gmail account for receiving email
- A mobile phone at which you can receive a text message (fees from your carrier may apply)

Know Your Pi

A Raspberry Pi is a small, inexpensive single-board computing device that runs a variation of the Linux operating system built specifically for the Pi platform. Many programs that run on a Raspberry Pi are written in the Python programming language.

Raspberry Pi computers have on-board memory and a CPU and graphics processing unit on the circuit board. Processing speed and amount of memory vary depending on the Raspberry Pi model used. SD (Secure Digital) cards store the operating system and other files. Most models have wired Internet, Wi-Fi, and Bluetooth connectivity. For simplicity, this activity uses a wired Internet connection, although it is possible to access the Internet on a Raspberry Pi using Wi-Fi via a USB dongle or on-board Wi-Fi, depending upon the model. (Sims, 2014)

A Raspberry Pi contains several ports and plugs to connect a variety of cables and devices, as shown in Appendix 1, Figure 2. The Raspberry Pi connects to other devices through its general purpose input/output (GPIO) pins which may send or receive signals from connected devices. You can program the pins to interact with devices, sensors, and other signals. Some pins are "ground" pins that do not receive current. Appendix 1, Figure 3 shows the pins and their names. To orient the Raspberry Pi correctly, hold it so that the GPIO pins are at the right edge.

For Your Lab Report: Know Your Pi What type of cables or devices might you connect or attach to each of the ports or pins, numbered 1 – 8 of Appendix 1, Figure 2?

For Your Lab Report: GPIO Pins Your Raspberry Pi has two pre-connected wires. What are the pin numbers and GPIO names of the pins to which they are connected?

4. CONNECT THE DOORBELL TO THE RASPBERRY PI

Appendix 1, Figure 4 shows the inside of the wireless doorbell receiver. To simplify the process of connecting the doorbell to the Raspberry Pi, and avoid damaging the wiring inside the receiver box, a red (positive) and black (ground) wire have been soldered to the corresponding wires inside the doorbell receiver.

You will connect the doorbell chime to the Raspberry Pi via the soldered red (positive) and black (negative) wires soldered to the doorbell's speaker so that you can easily connect them to the Raspberry Pi without concern about damaging the fragile wiring inside. When the speaker chimes after pressing the doorbell buzzer, wires attached to the speaker will carry the current to the Raspberry Pi through the clip wires that you attach to connect both devices.

Your kit contains three clip lead wires: two of one color, and one of another. The two clips of the same color will serve as the positive wires transferring the electrical current, the one clip of the other color will serve as a "ground" wire completing the circuit.

Clip one end of each positive wire (for which you have two clips of the same color) to the ends of a 220 ohm resistor. A resistor reduces current flow, and, acts to lower voltage levels within circuits. Use the clip of the same color connected to the other end of the resistor, to the wire coming from the Pi that is connected to the GPIO pin closest to the end of the Raspberry Pi that has USB ports.

Clip the other (Ground) wire to connect the speaker with the wire attached to a Ground pin (the pin closest to the end of the Raspberry Pi that does not have USB ports) on your Raspberry Pi. The completed setup is shown in the diagram in Appendix 1, Figure 5.

5. SET UP THE RASPBERRY PI

Follow these steps to set up your Raspberry Pi.

1. Connect the keyboard, mouse, Ethernet, and HDMI cables to the appropriate ports (Connect an external USB webcam if you are not using the built in Pi camera).

ISSN: 2473-3857

- 2. Verify that the MicroSD card is inserted.
- Turn on the monitor, and make sure input is set to come from the attached HDMI cable.
- 4. Connect the power cable to the Raspberry Pi and watch it boot.
- 5. Sign in to the Raspberry Pi using username *pi* and password *raspberry* .
- 6. Type the command *startx* to load a graphical user interface.
- 7. Open a file manager app and navigate to Desktop. You should see a folder named StarterFiles. Copy those files to a new folder on the desktop named Doorbell. Be careful that you name the Doorbell folder with a capital D.
- 8. Open the Doorbell folder and verify that it contains three files: webcam.jpg, sendnotify.py, wait_doorbell.py .

For Your Lab Report: Path A path describes the location of a file in a computer's storage. What is the path to the Doorbell folder that you created, stored on your Raspberry Pi?

For Your Lab Report: User Interface How does the user interface for the version of Linux on the Raspberry Pi resemble that of other operating systems with which you are familiar? How is it different?

6. TEST THE CAMERA

Locate the LXTerminal application's icon on the Raspberry Pi desktop. Click on the icon to open a window running LXTerminal. You can type commands into the LXTerminal app to run programs on the Raspberry Pi.

Type one of these commands to take a picture. Be careful to include spaces after the command name and the letter after each option specified by a minus sign (-). Be sure to smile!

- If you are using the built-in Raspberry Pi camera, type this command all on one line in the terminal window to take a picture: raspistill -h 300 -w 400 -n -o /home/pi/Desktop/Doorbell/webcam.jpg
- If you are using a USB webcam, type this command all on one line in the terminal

window to take a picture: fswebcam -r 960x720 -d /dev/video0 /home/pi/Desktop/Doorbell/webcam.jpg

Look in the Doorbell folder and click the webcam.jpg file to view the picture. Make sure it has the photo you just captured.

If you receive a permission denied error when running either webcam command, try typing it again, and preceded with the keyword *sudo*. In Linux, *sudo* ("super user do") is a program that gives you permission to run the command that follows with "super user" (often higher) privileges.

For Your Lab Report: Camera Where is the picture stored? What happens to the picture that was stored previously after you take a new one?

7. CODE CHECK: wait_doorbell.py

In this step you will examine the source code from wait_doorbell.py, shown in Appendix 1, Figure 5, to get a sense of how it works. You can open this file in a text editor app installed on the Raspberry Pi

The wait_doorbell.py file is a program written in the Python programming language. Its job is to wait until someone presses the buzzer on the doorbell, and when that happens, take a photo and send it in an email message. The program runs forever. The only way to stop it is to press the Control key and the C key (written as Control-C) at the same time.

The code statements to take the photo (19 or 22) are *commented out* – that means, they have a # symbol at the beginning which tells the computer to ignore those lines. As part of the exercise you will remove the # symbols from one of these lines so that the program runs them. Be careful not to change the indentation of any of the lines of program code.

For Your Lab Report: wait_doorbell.py Which line of the wait_doorbell.py program causes it to run forever until you press Control C? Which line's statement checks to see if somebody pressed the buzzer? What does the program do when that happens?

8. CODE CHECK: sendnotify.py

In this step you will examine the source code from sendnotify.py shown in Appendix 1, Figure

7 to get a sense of how it works. You can open this file in a text editor app on the Raspberry Pi.

ISSN: 2473-3857

The sendnotify.py program contains steps to set up the contents of an email message, and then send that message. The program calls sendMail (in line 51) to send an email message with an attachment to a recipient. Lines 14-46 specify the steps for the Raspberry Pi to send an email message from a sender's email address. Lines 55-59 specify the content of that email message.

For Your Lab Report: sendnotify.py In addition to a sender's email address, what four pieces of information are necessary for the sendnotify.py program to send an email message to a recipient? Where does the program get this information?

9. TEST THE CONNECTION BETWEEN THE DOORBELL AND THE RASPBERRY PI

In this step you will test the connection between the doorbell receiver and the Raspberry Pi.

- Open the wait_doorbell.py file in a text editor. (The text editor app has an icon on the desktop.)
- Change line 6 to replace 999 with the GPIO number of the pin receiving the positive charge. Look at Figure 1 to find the GPIO number. (This is not the pin number!)
- 3. Save this change in the text editor.
- 4. In an LXTerminal window, type *cd* (for change directory) and a space, followed by the path to the Doorbell folder that you created. Press the ENTER key to complete the command. This will change directory in the command window so you can directly run the programs in the Doorbell folder.
- 5. Type the command sudo python wait_doorbell.py and press the ENTER key to run the program. This command instructs the Raspberry Pi to run the Python program whose code is in the file wait_doorbell.py.
- 6. What do you see on the screen in the terminal window when the program runs?
- 7. Press the button on the doorbell buzzer. (It is possible and likely that your buzzer may cause several receivers in the room to chime if they operate on the same frequency. If this happens, press the

sound button on the back of the receiver unit.) What information displayed in the terminal window changes when you sound the doorbell?

8. The program will run forever. Press the Control key and the C key at the same time (Control C) to end the program and return to the terminal prompt.

For Your Lab Report: wait_doorbell.py Terminal Window When running the wait_doorbell.py program, what does the terminal window show when you are not pressing the buzzer? How does the contents of the terminal window change when you press the buzzer?

10. TEST SENDING AN EMAIL MESSAGE WITH A PHOTO ATTACHED

If the values in the terminal window change when you press the doorbell's buzzer, this should convince you that the Raspberry Pi is receiving input from the doorbell's receiver through the wires you connected to it. Now you will configure the sendnotify.py program to send an email message containing the photo as an attachment.

- Open the file sendnotify.py in another text editor window.
- Replace the values for USERNAME and PASSWORD in lines 11 and 12 to show the sender's username and password. This will be your doorbell email sender address and password provided by your instructor.
- 3. Select one member of your group as the person to receive an email notification. Replace the recipient's email address at the bottom of the program the recipient's personal Gmail address.
- 4. Save the changes to send_notify.py.
- 5. The # symbol starting a line of code in a Python program indicates a comment. The program will skip that line when it runs. In the wait_doorbell.py program, remove the # symbols at lines 19 or 22 (depending on which type of camera you are using).
- 6. Remove the # symbol starting line 26 to instruct wait_doorbell.py to run the sendnotify.py program. Also remove the # symbol starting the line that prints "Photo captured." This will instruct the program to print a notification message when the camera takes a photo.

7. Save these changes to the wait doorbell.py file.

ISSN: 2473-3857

These steps will verify that the program sends, and the user receives email messages.

For Your Lab Report: Commented Out What does the statement at line 19 or 22 that is not commented out, do?

On another computer or mobile device, one person in your group should sign into Gmail using the doorbell email sender address and password, provided by your instructor. Please note: If you already signed into Google with your own account because you are working on the lab report, then you will need to sign in using a different browser or using private browsing, so you can access your account and the doorbell email account in its own browser window.

Delete all sent mail from the doorbell sender account, so you can determine easily if the program is sending mail when you run the program. Navigate to the SENT folder and monitor it when you run the program.

The program on the Raspberry Pi should be able to send email messages from the doorbell sender Gmail address because security settings for that address are set to allow apps to send email messages. Please note: If it is not working, you may need to check the settings on that account. From the doorbell sender Gmail account, visit https://www.google.com/settings/security/lesss ecureapps and turn on access for less secure apps.

On the recipient's own computer or mobile device, the recipient should sign into his or her personal Gmail at the address specified to check if the email messages from the doorbell email account have arrived.

Navigate to the recipient's INBOX folder in Gmail and monitor any new messages that may appear when you run the program.

Click in the LXTerminal window, press the UP ARROW key to reissue the *python wait_doorbell.py* command (or retype it) to run the program and press ENTER.

11. TEST THE DOORBELL CONNECTION

With the wait_doorbell.py program running, press the buzzer on the doorbell.

Check the sender's sent mail and the recipient's received email. How many messages were sent when you ring the bell? If you received several messages, try adjusting value specified in the time delay of line 6 of wait_doorbell.py.

Check the sent mail and received mail accounts to see if the program sent an email message. Take a look at the picture.

For Your Lab Report: What values do you see in the LXTerminal window when the wait_doorbell.py program runs? What information does the program display in the terminal window before and after you press the buzzer? When does a message appear? Why?

12. SEND A TEXT MESSAGE

To send a text message via email, you must use a SMS (simple messaging service) to email gateway. By sending an email message to an address containing the mobile number of the recipient, the gateway will forward the emailmessage as a text message. Substitute a 10-digit cell number for 'number' for each carrier's name. Table 1 shows email gateways for popular cellular carriers. If you have a different carrier, use a search engine to find the gateway email address for your carrier.

Table 1. Carriers and Email gateway addresses.

Carrier	Email Gateway Address
AT&T	number@txt.att.net
T-Mobile	number@tmomail.net
Verizon	number@vtext.com
Sprint	number@messaging.sprintpcs.com

Copy the code at lines 55 to 58 of sendnotify.py that sends an email message to a recipient. Paste it at the bottom of the file, after the existing code. Replace the recipient's email address with an email address containing your ten-digit phone number (with no dashes, spaces, or parentheses) and the correct email gateway for your mobile provider.

Run send_notify again, press the doorbell buzzer, and see if you receive both an email message and a text message on your phone.

For Your Lab Report: Add these screenshots to your lab report:

 The email message sent from the sender's Gmail account

ISSN: 2473-3857

- The email message and attached photo received in the recipient's personal Gmail account
- The text message received on the recipient's mobile device

13. CLEAN UP

Complete these steps to remove the files you created, then disconnect and power off the Raspberry Pi.

- 1. Delete the Doorbell folder on the Raspberry pi desktop containing the files you modified and the webcam photo.
- 2. Power off the Raspberry Pi.
- 3. Disconnect the wires, power supply, and connected devices from the Raspberry Pi. Disconnect the clip wires from the doorbell. Place all of the parts back in the plastic bag as you received it.

For Your Lab Report: (To be answered individually) What was the most difficult part of this lab activity for you? How did this activity help you learn about the Internet of Things? What did you learn?

For Your Lab Report: (To be answered individually) What everyday items have you seen or would you like to see connected to the Internet? What does or would connecting those items to the Internet enable you to do?

Review and discuss the answers with your group, and share the Google Doc with the instructor at the Gmail address provided.

14. ACKNOWLEDGEMENTS

The author acknowledges Tejas Shah, MSIT student, who helped debug this lab activity, and Prof. Bill VanderClock, whose adeptness with a soldering iron increased durability of the doorbell equipment and simplified the activity for students.
