## Abstract

This paper describes the study of enforcement of prerequisites in the Computer Science program at a regional university in the Southwest. Prerequisites are a significant factor in programs of study in higher education. Allowing students to register in courses may assume that they have existing knowledge and skills. Some programs treat prerequisites as advisory, while others consider them mandatory. In the latter case, procedures usually exist to make exceptions in the form of registration overrides. The state of prerequisite enforcement at our university over the years, and some factors that may have influenced adherence to the prerequisite structure over the years, will be discussed at the conference.

**Keywords:** enrollment, curriculum, prerequisites, scheduling, graduation.

## 1. INTRODUCTION

In higher education, courses may have prerequisites and/or co-requisites to ensure that students taking the course are sufficiently prepared. In reality, enforcement of these prerequisites may be difficult. For instance, enrollment systems cannot check prerequisites until after the semester end because course grades have not been awarded and enrollment for the next semester starts well before the current semester ends (Boyer & Bucklew, 2019). A variety of processes exist to deal with this timing problem.

The issue of enforcing prerequisites is especially important when the demand for a course exceeds the course capacity. Students who should not be taking the course (yet) take a seat that should have gone to students who do qualify (Soria & Mumpower, 2012).

This research will examine the compliance with successful completion of prerequisites and

enrollment in co-requisites in the Computer Science program where the investigators teach. The paper is organized as follows. In the next section, we discuss the relevant literature. Next, we discuss the methodology of our study. We end with conclusions and recommendations.

## 2. LITERATURE REVIEW

Prior knowledge and skills needed to be successful in a course can take multiple forms. Prerequisites can be defined as courses or tests that must be successfully completed prior to registering for the target course. In some cases, special tests are given at the start of a course to identify students who need additional support to get caught up. Co-requisites are courses that must be taken at the same time as another course. In the case of labs partnered with lecture sections, the reason for the split is usually administrative – multiple lab sections with fewer students are needed to give all students sufficient individual attention in the lab. In other cases, the

material in one course is supportive of the target course. For instance, Discrete Mathematics may be co-requisite for Basic Computer Architecture to cover Boolean logic more in-depth in the mathematics course.

### **Rationale for expecting prior knowledge**

Curriculum design involves combining multiple courses into an integrated program of study. Considering limitations of time and other resources, programs should maximize coverage of content while minimizing overlap. As Diamond (1998) states:

“One of the most prevalent problems in course and curriculum design is the tendency of faculty to make false assumptions about the knowledge and skills that students bring to their courses. These incorrect assumptions lead to failure for the students who are ill prepared, boredom for their classmates who are often more than adequately prepared, and frustration for the faculty.”

Performance in advanced courses depends on how the material in prerequisite courses is used and evaluated (Nelson et al., 2020). Lack of correct prerequisites and lack of continuity between courses in a sequence are specifically mentioned as causes of student failure (Babb et al., 2014). “Depth of knowledge” assumes a hierarchical structure of programs (Reynolds et al., 2016). This is not limited to a single program of study. If programs have more than one concentration, two or more sequenced courses within the concentration are required (Downey et al., 2008).

Babb et al. (2014) propose that students must “step-wise and incrementally, engage in the persistent and iterative pursuit of programming” of at least 15 out of 23 topics. Longenecker et al. (2013) suggest a series of three programming courses with database as prerequisite for the last course. Decreasing the number of programming courses in the early 2000s backfired, and industry continues to demand technical skills (George & Marett, 2019).

Prerequisites do not come without drawbacks. Students can suffer delays in graduation, and universities may have to offer more courses with a deeper prerequisite structure (Reynolds et al., 2016). For some students, it can be a reason to select another major (Li et al., 2014). It is therefore important to impose only prerequisites that are necessary and effective.

### **Effectiveness**

Much of the research on prerequisites has focused on its effectiveness. The effect of prior knowledge has been tested statistically through correlation of prior coursework and final grades in the target course, and by correlation with special pretests at the start of the target course.

Examples of studies that use final grades in the target course are Blaylock & Lacewell (2008), Krause-Levy et al. (2020), Liao et al. (2019), and Soria & Mumpower (2012). All found positive relationships between prerequisites and target courses.

Passing previous courses may not be effective. The use of proficiency tests instead of prerequisite courses has been described by Rondeau & Li (2009). Instituting the test created a backlog of students who failed the test, and the test did not fully cover the required knowledge. Also, not all prior knowledge can be obtained in a single course. Blaylock & Lacewell (2010) used a prerequisites test covering topics from multiple disciplines to demonstrate that prior knowledge led to better final grade results. Sargent (2013) used proficiency tests for Intermediate Accounting with good result. Abou-Sayf (2009) concluded that using entrance tests in the target course provided more accurate results than using final grades.

Higher education has become increasingly fluid. Whereas decades ago, students tended to complete degrees in one institution, the last decade has seen an increasing number of students who transfer from community colleges to four-year institutions to finish their degree. Transfer agreements between schools and state transfer guides (for instance OSRHE (2022)) help students to combine courses from multiple sources into a single degree. Needless to say, this assumes sufficient similarity of course contents to be successful. The effect of transfer guides on the number of prerequisites taken elsewhere is small, and mature students benefit more (Spencer, 2019). Furthermore, Catanese et al. (2018) found no significant difference in a third computing course between native students and transfer students who took the first two courses elsewhere.

Finally, some problems exist in quantitative measurement of the effect of prerequisites. Students are more mature in the target course, the students in the prerequisite and target course partially overlap, self-selection happens due to students not following up with the target course,

and a cause-and-effect relationship has not been demonstrated (Abou-Sayf, 2009).

### **Selection process**

The second main area for prerequisites research is in the selection process. One of the first questions in delivering courses is the issue of prerequisite knowledge (Johnson et al., 2002). In some cases, this is easy. Database II should have Database I as direct prerequisite (Reynolds et al., 2016). Computer Science II should be preceded by successful completion of Computer Science I, and Object-Oriented Programming (in Java) might need the coverage of objects in C++. Model curricula may suggest this type of sequential prerequisites. In IS2010 and IS2020, Foundations of Information Systems is prerequisite for most other courses, and all other courses must be passed before culminating courses like the capstone course (Leidig et al., 2019; Leidig & Salmela, 2021).

Other prerequisites may be less intuitive. Some courses have non-sequential prerequisites from other disciplines. For instance, some programming courses may need the logical thinking from specific Mathematics courses. White found that prerequisites are needed to develop the proper cognitive style in order to be successful in Visual Basic programming (2012). In a follow-up study, White and Sivitanides suggested that freshman level mathematics courses are good indicators for success in Visual Basic (2003). To fully understand the issues round technology-based entrepreneurship, a course on information systems in business is essential (Jones & Liu, 2017).

### **Level of enforcement**

Registration systems contribute to the problem of skipping prerequisites (Wilkerson et al., 2019). As mentioned before, course registration systems have difficulty enforcing prerequisites if registration for a future semester is allowed before grades in the current semester have been posted. Several solutions to this dilemma exist.

First, universities may use conditional enrollment pending successful completion of the prerequisite. Second, appropriate staff can issue overrides. Academic advisors may have permission to issue an override if transfer courses have not been posted in the transcript system yet, and faculty may override enrollment blocks in courses they teach if they deem the prerequisite unnecessary for specific students. Departments can give overrides for courses in their department. An example of this process can be found at OSU (2021). Third, enrollment

without prerequisite may not be blocked. Course descriptions may merely mention prerequisites, and students can not notice or ignore them. In that case, it would be up to faculty to check transcripts before or at the start of the course. Finally, the university may only open enrollment after grades in the current semester have been posted. This pushes enrollment back compared with early registration and is unattractive from an administrative point of view. Overall, Soria & Mumpower (2012) found that a switch to enforced prerequisites led to better academic outcomes.

The need to check grades does not exist for co-requisites. If the course has been taken before it is available in the transcript system, and if not must be taken in the same semester as the target course. Registration systems could check if the co-requisite is covered and either disable registration until it is met or issue a warning that the co-requisite course must also be registered.

In closing, student compliance with prerequisites and co-requisites is a multi-faceted issue. The literature indicates that they are effective, gives some guidelines for their selection, and that they may not always be followed. We have not been able to find literature indicating how often they are skipped, and that is the focus of this study.

## **3. METHODOLOGY**

This section describes the methodology of measuring compliance with successful completion of prerequisites and enrollment in co-requisites for the Computer Science program.

### **Online university systems**

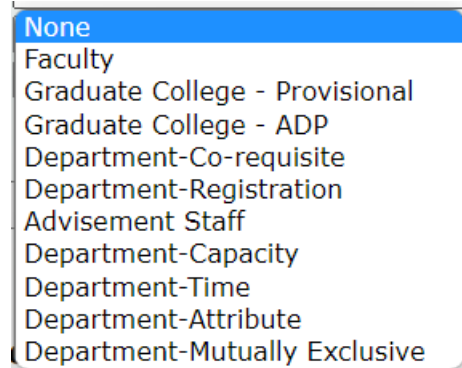

Students register on Banner and transcripts can be checked on DegreeWorks. We use Python scripts with Selenium to extract lists of students, either CS majors and minors, or students registered in specific CS courses. Likewise, we use Python scripts with Selenium to download transcripts and extract the data needed.

### **Course registration system**

The Banner system (Ellucian Company LP, 2022a) is a comprehensive suite that includes student course registration and instructor functions like generating course enrollment listings and grade entry. Enrollments are synchronized nightly with the course management system BlackBoard. The gradebooks in BlackBoard contain the student identifiers for each course.

Registration overrides may be customizable by the university, allowing different users and

groups different permissions. At our university, overrides for undergraduate courses can be issued by faculty, department, and academic advisors (Figure 1). Prerequisites are not listed as a reason. Academic advisors contact faculty for prerequisite overrides. This typically happens between Software Engineering and its target Capstone course.

**Figure 1 - Types of overrides**

**Transcript system**

DegreeWorks (Ellucian Company LP, 2022b) allows selecting single students based on their N number (a unique number unconnected with other identifiers such as social security numbers) but also has a search function that includes searching on majors and minors. The results of each search are displayed in a popup window with name and N numbers.

The frequency of synchronization between grade entry on the Banner system and the transcripts in Degreeworks is not known but assumed to be frequent since both packages are sold by the same company. The "historic audit" dropdown shows multiple snapshots during the semesters, and the "date refreshed" field can be used to refresh the current transcript on the fly.

Transcripts show all required courses for the program of study, the semester when taken or scheduled, the course grade status, and special notes for course transfers and substitutions. Sample (anonymized) transcripts for native students and transfer students are shown in Appendix A.

**Prerequisites in the CS program**

The Computer Science program has multiple courses with prerequisites or co-requisites. Some are sequential, such as Computer Science I and Computer Science II which even use the same textbook. Other courses are non-sequential, such as Object Oriented Programming and Software Engineering. The course content in the

programming course is not used directly in the target course, but the intent is to ensure that students have sufficient programming background to start preparing for the Capstone course. A complete listing of common courses with prerequisites is provided in Table 1. Some courses with prerequisites in the course catalog are seldom or never offered, and we ignored those. We also omit courses restricted to instructor permission only.

Course	Prerequisite/co-requisite
Computer Science I	Applied Mathematics (co) or College Algebra (co) or ACT >=23 and computer proficiency
Computer Science II	Computer Science I with C minimum
Object Oriented Programming	Computer Science I with C minimum
Basic Computer Architecture	Computer Science II (co) and Discrete Mathematics (co)
Computer Operating Systems	Basic Computer Architecture
Data Structures	Computer Science II with C minimum and Discrete Mathematics
Software Engineering	Object Oriented Programming with C minimum
Capstone	Software Engineering
Database Management Systems	Computer Science II and Discrete Mathematics

**Table 1 - Courses and prerequisites**

Based on prerequisites in required courses, the program has a critical path to graduate in four semesters after General Education requirements have been met. The critical path is shown in Figure 2. In all three versions, completing the upper division courses in four semesters is only possible with the sequenced prerequisites Computer Science I, Object Oriented Programming, Software Engineering, and Capstone (Professional Development in CS).

This critical path has been shortened about six years ago. Before the change, the prerequisite for Object Oriented Programming was Computer Science II, not Computer Science I. The critical path at that time had a length of five courses with Computer Science I, Computer Science II, Object Oriented Programming, Software Engineering, and finally the capstone course. Even though we

felt that Computer Science II was a better prerequisite for Object Oriented Programming than Computer Science I, we decided to shorten the path. This demonstrates that some of the considerations in the use of prerequisites are political as noted by Abou-Sayf (2009).

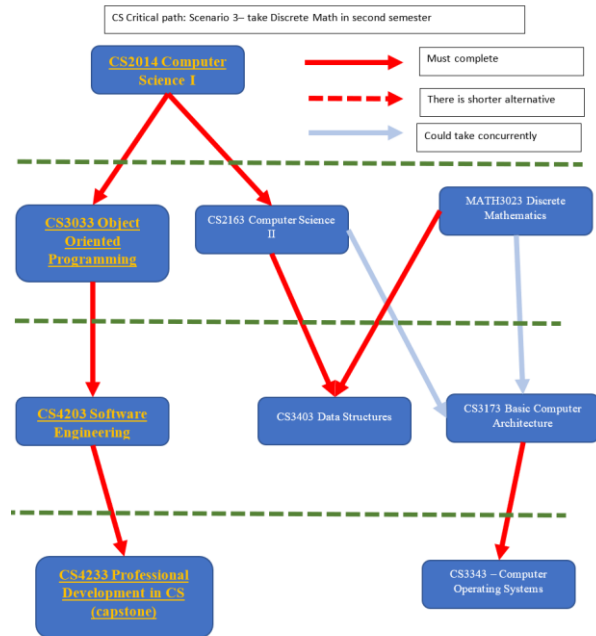

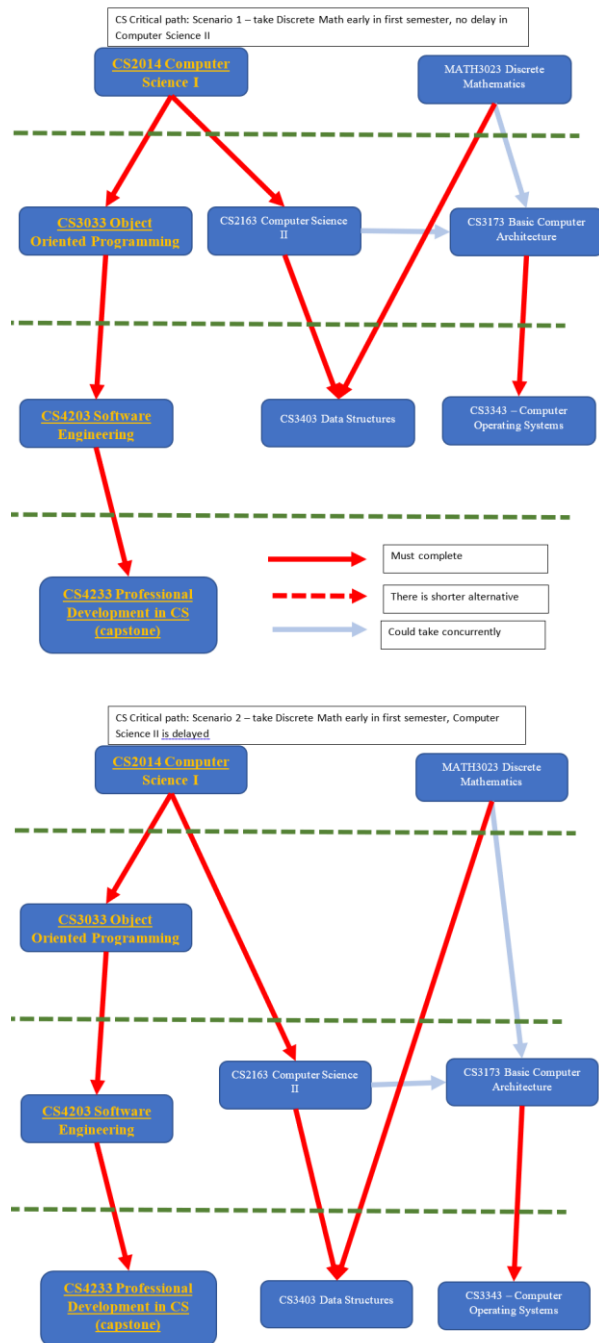

Figure 2 - Critical Path in CS

**Course rotation**

The CS program is offered on two campuses. In the past, courses were only offered face to face (f2f) on alternating campuses. With the advent of powerful online meeting tools like BlackBoard Collaborate and later Zoom, courses were increasingly split in two sections, with one section f2f and the other online concurrently. This allowed students to take courses each semester independent of their main campus, and the course rotation is shown in the first image in Appendix B.

Starting with the Fall 2021 semester, the course offerings were reduced to once a year and agnostic of campus. Faculty could select the campus for the f2f section and stream the course to the other campus. The faculty with doctoral degrees were reduced from five to three by releasing two faculty on the tenure track and not replacing them. The road map with implicit course rotation is shown in the second image in Appendix B.

The road map for CS shows that CS courses are spread over four years and eight semesters. In our program, approximately half of the CS majors complete all four years at our university, but the other half consists of transfer students from community colleges. For those transfer students, and students who do not declare CS as their major until after completion of their General Education courses, students can combine the major and minor courses for the first and second

years in the appropriate semesters, as well as combining the third and fourth years. For all students though, most of the required courses are offered only once a year. This complicates proper course selection for our majors.

### Scraping web data

All course registration data and all transcripts are accessible online at the university website. One of the current popular tools for collecting online data is a combination of the Python programming language and the Selenium module to automate user actions in web browsers (Chapagain, 2019). The Scrapy module (Zyte, 2022) is faster due to multithreading but does not render JavaScript and is not very user-friendly. BeautifulSoup (Richardson, 2015) needs additional modules for sending requests and parse HTML pages. Selenium is easy to use, sends its own requests, and can pull data that is only available when JavaScript is loaded (Grimes, 2022).

### Research questions

After student lists have been downloaded from the transcript system and from BlackBoard, we will download anonymized transcripts. The data will be used to answer the following questions. Since we have access to all transcripts for CS majors for more than a decade, it is possible to check for changes over time.

1. What is the historical compliance with prerequisites?
2. What is the historical compliance with co-requisites?

The literature mentions sequential and non-sequential prerequisites. The need for non-sequential prerequisites might be less clear to students and this might negatively affect compliance.

3. Is there a difference between the compliances of sequential course pairs and non-sequential course pairs?

Specific to our program, some structural changes may have affected compliance. We can examine the following two changes.

4. Did the change from CS II to CS I affect the prerequisite compliance for Object-Oriented Programming?
5. Did the change in course availability affect compliance with prerequisites and co-requisites?

Finally, co-requisites can be taken before or during the target course. We might expect differences in performance based on timing of the co-requisite.

6. Should some co-requisites be converted to prerequisites?

## 4. CONCLUSIONS AND RECOMMENDATIONS

Prerequisites and co-requisites play an important role in setting students up for successful completion in higher education courses. Enforcement of prerequisites varies between universities, and within universities themselves. In our Computer Science program, prerequisites and co-requisites are mix of sequential and non-sequential couples with target courses. At our university, neither formal administrative review procedures exist for conditional enrollments, nor enrollment restrictions until successful completion of prerequisites is known. Consequently, enforcement of prerequisites is left up to individual faculty. Furthermore, with two campuses and a culture of permissiveness regarding enrollment, completion of prerequisites and enrollment in co-requisites may need closer scrutiny.

Computer Science includes the skills to write software to automate occupational tasks. Both the student registration system and the transcript system are online systems, and Python with Selenium can automate retrieving transcript data to check prerequisites at the program level as well as the individual course level.

Based on the results of transcript analysis at both levels, student success can be supported by multiple individuals. Academic advisors can generate or receive lists with students needing to take the target course of prerequisites they take in the current semester. These lists can be used in advising sessions, to contact students proactively by email or text message, and to check courses needed against actual enrollments. Faculty can easily check prerequisites and co-requisites in the courses they are about to teach to maximize the enrollment of eligible students by eliminating non-eligible students. The CS program can use the results to review the structure of the program and the enrollment limitations needed to follow the proper study paths.

We have discussed the planned review of prerequisites and co-requisites in the Computer Science program at our university. Results of the review will be discussed at the conference and may be included in future publications.

### Degree in Bachelor of Science INCOMPLETE

Credits required: 124    Credits applied: 40    Catalog Term: Fall 2021

A MINIMUM of 124 hours is required. You have 40 (includes in-progress work).

A MINIMUM of 30 hours in residence (from NSU) is required. You have 40 (includes in-progress work).

A MINIMUM of 40 hours of 3000/4000 level courses is required. You have 0 (includes in-progress work).

A MINIMUM of 60 hours from a 4-Year school is required. You have 40 hours (includes in-progress work).

A MINIMUM of 55 hours of Liberal Arts & Sciences (LAS) courses are required for Bachelor of Science degrees. You have 40 (includes in-progress work).

<input type="radio"/> Minimum 124 hours	<b>Still needed:</b>	You need at least 84 more hours. PE activity is limited to four hours. Prior learning credit (CLEP, Advanced Standing, Military Credit, etc) is limited to 30 hours. You must satisfy the requirements under each section of this audit in order to graduate which may total more than the MINIMUM 124 hours.
<input type="radio"/> Minimum 30 hours from NSU		
<input type="radio"/> Minimum of 40 hours at upper level	<b>Still needed:</b>	You need 40 more upper-level hours.

## Major in Computer Science, BS INCOMPLETE

Credits required: 45 Credits applied: 3 Catalog Term: Fall 2021

### Unmet conditions for this set of requirements:

45 hours are required. You have 3, (includes in-progress work) and you need at least 42 more hours.  
A minimum of 21 hours must be taken in residence. You have 3 (includes in-progress work) and you need 18 more hours. Hours in residence (from NSU) EXCLUDE prior learning credit such as CLEP, Advanced Placement, Advanced Standing, Military Credit, etc.  
A minimum of 21 upper level hours are required. You have 0 (includes in-progress work) and need 21 more hours.  
Minimum GPA unsatisfied

Your current major GPA is 0.000.
