On Becoming: Why Disposition Distinguishes Education from Training

Abstract

In 2020, the IEEE/ACM Computing Curricula 2020 report, the ACM/AIS/ISCAP Undergraduate Model Curriculum, and the AASCB Standards for Business Accreditation were all released. Each refers more prominently to dispositive aspects of the knowledge, skills, and capabilities that a curriculum is used to shape, hone, and prepare graduates. Both the CC2020 and IS2020 reports specifically recommend a competency-based curriculum in which dispositions are both a relatively new addition as well as an addition that may be fraught as the consideration and/or adoption process proceeds. New curricular guidelines, model curricula, and accreditation standards provide an occasion for assessment and reflection such that foundational assumptions may be reviewed. The competency model challenges Information Systems curriculum design in two key aspects that are the subject of this paper. First, the dispositive dimension poses key challenges in the Information Systems discipline and provides a new area of focus in the literature on Information Systems curriculum development. Second, the inclusion of dispositions in the CC2020/IS2020 competency model provides an opportunity to explore interconnections that can be more informative than course containers, course descriptions, and lists of topics. Dispositions provide an opportunity to also consider students' learning and growth facilities by focusing on what facilities the growth of competency beyond the application of knowledge and skills. We promote the uptake of the CC2020/IS2020 competency model by focusing on and advocating for dispositions as a means of accounting for, and designing for, students' 'becoming' in their advancement in the application of skills and knowledge in the task environment. The dispositive component of the competency model promises extended expression, facility of comparison, and clarity in exchange to bring utility and understanding in the Information Systems curriculum development process.

Keywords: professionalism, competency, mindset, dispositions, accountability, computing education, curriculum design.

1. Introduction

Recent computing curricula reports (CC2020), and specific disciplinary model curriculum reports (CC2020, IS2020, and the impending CS2023

and DS2023) have been authored using a competency approach to modeling computing curricula. A key component of the models in these reports is the inclusion of dispositions in the model. As dispositions suggest the habitual

inclination and tendencies that best facilitate the development of the skills and knowledge that underly successful development of the competency, the inclusion of dispositions, which can be thought of as being somewhat subjective, could be construed as a shift towards the esoteric. This presented opportunities for friction and for growth. We next examine how others have examined dispositions in computing curriculum development.

Knowledge Areas, Knowledge Units, and Learning Outcomes (KA, KU, LO) were common ontological organizations in model curricula development 20 years ago. While they are still useful to articulate the knowledge elements and skills levels inherent in the CC2020 competency model, these elements (KA, KU, LO) can usually be directly observed: a developed algorithm, a security policy, a normalized schema, or UX design. However, the potentially fraught and beneficial aspect of the CC2020 and IS02020 competency model is the inclusion of dispositions. Dispositions, which at first seem immediately familiar, quickly become inscrutable as they must be explicated, articulated, and reconciled as mediators and moderators of the full competency expression; more so when a competency expression attempts to match a given task environment.

Dispositions are arguably a matter of the affective cognitive realm (Ben-Ze'ev, 1997) and arguably occupy a similar space as that of Covey's (2020) seven habits. Like Covey's habits, dispositions may be understood as conditions, or habits of mind, that assists in problem framing and solution When we enter the behavioral and desian. affective realm of dispositions in the competency model, they may strike some as being apart from the more concrete elements of computing knowledge. Thus, while computing accreditors, such as ABET, do not shy away from specifying attention to sociologic and behavioral psychologic realms in their criteria for computing programs, the authoring and pedagogical implementation of dispositions remains relatively new ground in model curricula for Information Systems. That is, we are used to students' demonstration of computing knowledge and ability, via observable artifacts, and less so from the enabling habits and attitudes that facilitate.

In this paper we will explore the essential nature of the dispositive component of the competency model and suggest that the investments in the dispositive dimensions of competencies can be meaningful and long-lasting as student progress in their careers. In this sense, we advocate that dispositions serve as a "glue" used to adhere the vital component of a competency's contextual application in a task environment to the foundational knowledge needed to facilitate computing solutions.

Because dispositions may not be a common element in many skills-oriented technical courses and curricula, or because other collateral disciplines may assume the mantle of basic principles of habit and behavior, it is likely that dispositions and their importance can be missed in the development of competencies. Whereas recent guidance from model curricula (IS2020) or accrediting bodies (the ABET CAC Criteria) place a firm emphasis and embrace on the indelible and concrete technical knowledge and skills, the benefit of examining the seemingly esoteric essence of dispositions is the appeal made in this paper. Dispositions are vital as they reflect the knowing-in-action (Schön, 1995) that can be best shaped by discovering both explicit and implicit purposes and placement of disposition in competency expressions of curricula.

Lastly, this paper proposes that the lasting value of dispositions is their reflection of the evergreen habits of orientation, perspective, and framing that are the hallmarks of reflective practice of an IS professional (Brown, 1995; Rein and Schön, 1996). We hope that the reader will develop a greater appreciation for the potential, pitfalls, and nuances possible with care for what dispositions bring to the table in the CC2020/IS2020 competency model.

The paper proceeds as follows. First, we examine the purpose and placement of dispositions within the competency model. We next examine the literature on dispositions regarding competencies in computing curriculum development. We next explore how the CC2020 competency model was manifested in the IS2020 model curriculum with some text analytic techniques. With that, we next postulate on what typical challenges would be encountered in specifying dispositions during competency development. We conclude with potential benefits and purposes of dispositions with regard to overarching goals for academic computing programs and the student outcomes they facilitate.

2. The Significance of Disposition in Competency

CC2020 asserts that adopting its competency model enables educating, prescribing, and evaluating a practice of computing that delivers a broad range of practical benefits to society: students, benefactors, faculty, administrators, employers, accreditors, lawmakers, and society.

"Describing computing competence in a practical context shifts the focus of curricula away from describing a body of knowledge in relation to a disciplinary area and channels it toward pragmatic [...] accomplishment and performance. It challenges [... developing ...] proficient computing professionals, and it allows society to recognize the purpose and benefits of [... computing ...] within a competency framework." (cc2020)

Indeed, at the CC2020 project's inception in early 2017 the capability and character of "proficient computing professionals" fused as the driving theme. The transformation from "knowing" to "practicing" was driven by both a commitment that students "learn better" and that graduates "perform better" in the real world. CC2020 set aside the tradition of a narrow preoccupation of dissecting computing as a body of knowledge to supplant it with a more comprehensive conception, that of competent professional action and conduct. CC2020's model of competency categorically represents professional action and conduct as "knowing what," "knowing how," and "knowing why."

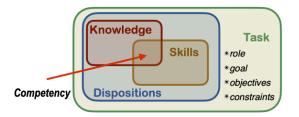

Figure 1. Competency = [Knowledge + Skills + Dispositions] in Task (Clear & Parrish et al., 2020)

The new, key element is **disposition** that explicitly fuses action and conduct to the effect of purposeful behavior.

disposition ... Natural tendency or bent of the mind, esp. in relation to moral or social qualities; mental constitution or temperament; turn of mind...

[Oxford English Dictionary]

Disposition's role in competency (both formative and performative) enjoins delineating traits that characterize "professionalism." In concert these traits commonly interpret a "professional **mindset**." CC2020 elaborates their formative intention of disposition in competency as follows: The meta-language of competency, "knowing what," "knowing how," and "knowing why," crisscrosses domains of scientific fact, practiced and cultural norms. behavior, Scientific (technically rational) fact and practiced behavior lend themselves to a categorical assessment: true or false, present or absent, consistent or inconsistent, it works, or it doesn't. Dispositions enfold intellectual, social, and moral predilections or tendencies that influence behaviors that do not lend themselves as easily to a categorical assessment. These predilections reflect value judgements that are not amenable to scientific proof. Values may differ or be held differently among individuals or cultures. And value judgements are also often mutable over timeaffected by the experience of practice!

Dispositional expectations enrich the description/assessment of competency and/or the related pedagogy. Ascribing a disposition to a competency indicates a clear commitment to self-reflection and a sober examination of mission, goals, and objectives to reach the clarity that enables its effective integration in curriculum design, the agency of pedagogy, and the character of professionalism.

Disposition is an area that clearly distinguishes competency from a learning outcome and is an essential characteristic of a well-structured competency. As such it represents a significant extension in the expressiveness of learning goals and adds language common to professional expectations. However, when used in free form, such terms may easily become vague or difficult to interpret. This is where the specification of a competency-that is the combination of the freeform text with its constituent K+S+D in [Task] framina—becomes more valuable. The competency statement is prose that succinctly conveys the essential intention of curricular details, while the structured enumeration of the K-S pairs and D elements conveys intention in action. [CC2020 p134]

Discerning and incorporating disposition in a competency specification of computing actions and conduct described in practice, empowers agencies of licensure, managers, educators, and communities to formulate, recognize, and effectively assert a whole of values and commitments that they deem characteristic to the judgement and conduct of a practitioner who is worthy of trust and respect as a professional.

The CC2020 decision to enfold dispositions to stipulate the character of professional practice clearly articulates what distinguishes educating

computing professionals from training computing practitioners.

train ... To subject to discipline and instruction for development of character, behavior, or skill... To give sustained instruction and practice to... [Oxford English Dictionary]

educate ... To teach (a child) a program of various academic and non-academic subjects, typically at a school; to provide with a formal education.

[Oxford English Dictionary]

3. Dispositions in the Literature

Since 2017 (Sabin, et al., 2017), the benefits of recognizing dispositions and task context in competency statements for computing curricula have become more obvious (Frezza, Daniels, Pears et al., 2018; Takada, Cuadros-Vargas, Impagliazzo, et al., 2020). Furthermore, developing and including dispositions in competency statements is critical to advancing the use of competencies for describing the goals of tertiary education. In part, dispositions serve as a lens through which student behavior can be observed (Frezza, Clear & Clear, 2020; Watson, Besmer, Banks et al., 2021). In a professional setting, dispositions are observed in relation to conceptual and procedural knowledge (Billing, 2007). This study intends to understand and advance the development and inclusion of dispositions in competency statements.

To understand to what extent and where the dispositions proposed in the CC 2020 report (Clear & Parrish et al., 2020) appear in the literature, we formulated gueries in Google Scholar for four major publication outlets. The primary audience for these outlets is educators in three computing disciplines, i.e., computer science, electrical engineering, and information systems. Table 1 shows the number of publications for each disposition that appeared in the ACM Transactions on Computing Education (ToCE), IEEE Frontiers in Education (FIE), ISCAP Information Systems Education Journal (ISEDJ), and ISCAP Journal of Information Systems (JISE). Table 1 shows that all dispositions have been studied, albeit to different degrees. Being collaborative or professional has been studied the most frequently in these outlets whereas being meticulous or passionate has been studied least frequently. The Google Scholar search queries for these dispositions are described in Appendix B. Most of these articles were published in the last ten years; for example (Cabo, 2021; Frezza & Adams; 2020; Groeneveld, Vennekens & Aerts,

2021; Jacob, Montoya, Nguyen & Warschauer, 2022; Knestis, Cheng, Fontaine & Feng, 2022; Podeschi & DeBo, 2022; Waguespack, Yates & Babb, 2022; Wijeratne, Dennehy, Quinlivan et al., 2022) have appeared since 2019. However, many relevant articles appeared before 2010, e.g. (Bryant, Campbell & Kerr, 2003; Graham & Caso, 2002; Guthrie & Navarrete, 2004; Richards, 2009; Saulnier, 2005; Sterling & Brinthaupt, 2003; Urquiza-Fuentes & Velázquez-Iturbide, 2009; Williams & Upchurch, 2001).

From the more than 2,000 articles counted in Table 1, we wanted to discern the areas in which areas the authors had focused their research on dispositions. To do this we identified the six articles that Google Scholar considered most relevant for each of the dispositions and each of the publications in Table 1. The result of this bibliometric analysis yielded 138 articles. Thirtyfour of these articles appeared in ACM ToCE, 41 in FIE, 33 in ISEDJ, and 30 in JISE. The 25 words that appeared most frequently in the titles of these articles appear in Table 2. Several of the words in Table 2 reflect the fact that the audience of our four publication outlets are educators, e.g., learning, education, students, teaching, course(s), curriculum, and knowledge. Most of the other words are commonplace when describing computing disciplines, e.g., computing, engineering, computer, information, systems, programming, science, technology, etc.

Words in Article Titles (see Appendix D)	Word Frequency
Learning	43
Education	25
Students	24
Computing	23
Engineering	20
Computer	18
Information	16
Systems, Teaching	15
Course, Programming, Skills	14
Curriculum, Development	13
Assessment, Courses, Student	12
Study	10
Online, Science, Technology	9
Knowledge, Professional, Project, Thinking	8

Table 1. Word frequency distribution for titles resulting from bibliometric analysis.

We also wanted to visualize the 138 article titles in word clouds to understand what themes (not just words) appeared most frequently. Figure 10 extends Table 2 from 25 words to 50 words. The

words in yellow and orange in this figure add insights beyond those derived from the data in Table 2. For example, the word "design" reminds us that computing disciplines are disciplines of design (Brooks, 2010), including information systems (Babb, Waguespack & Abdullat, 2019). The word "attitudes" reminds us that most of the published work in computing education frames competencies in the language of knowledge + skills + attitudes (Volman, van Eck, Heemskerk & Kuiper, 2005) rather than knowledge + skills + dispositions (Clear & Parrish et al., 2020; Sabin, et al., 2017). Also, that "professional" and "collaborative" are the only two dispositions that appear by name in Figure 10 is consistent with the fact that these are the most studied dispositions listed in Table 1.

Table 2. Dispositions, synonyms, and adjacent concepts used in queries to identify relevant articles. Figure 2 provides details of the search terms used to develop the list.

A word cloud analysis provided an additional perspective by considering both phrases and words. The most common word in our article titles - learning - isn't just about student learning. "Learning" also appears in article titles that refer to problem- or project-based learning [seven articles, e.g., (O'Grady, 2012; Woodward, Sendall & Ceccucci, 2010)], self-directed learning [two articles (Johnson, Ulseth, Smith & Fox, 2015; McCartney, Boustedt, Eckerd, et al., 2016)], and learning enhanced by reflection (Barroso & Morgan, 2012) and technology (Motschnig-Pitrik, Kabicher, Figl & Santos, 2007). We saw in Table 2 that "information" (row seven) and "systems" (row eight) occur at about the same frequency. However, these words often appear as part of the phrase "information systems" (IS), referring to IS course(s), IS curriculum, and IS education, for example, as in (Saulnier, 2009; Nwokeji, Stachel, Holmes & Orji, 2019; Topi, 2019).

4. Dispositions in IS2020

The IS 2020 report (Leidig & Salmela et al., 2020) argues that dispositions are essential components of competency statements, because there "is often a character and quality of application inherent in the domain and context of application that suggests the qualifiers inherent to that domain. The *computing-of-x* and *x-computing* phenomena suggest that demand for the contextualized use of knowledge-skill pairing in IS will continue to rise as the pervasiveness and ubiquity of computing into nearly all aspects of society, organizations, government, and business

continues in a process often referred to as digitalization. Dispositions are the adjectives that bring the socio-technical aspects of technology use to bear" (pp. 38-39). Leidig and Salmela et al. (2020) go on to enumerate 178 competencies in the report (pp. 95-182), including their knowledge-skill pairs and "key dispositions" (p. 97).

Disposition	Synonyms and Adjacent Concepts	
Adaptable	flexible, agile	
Collaborative	team player, influencing	
Inventive	exploratory, curious	
Meticulous	attentive to detail, attention to detail	
Passionate	with passion, with conviction	
Proactive	with initiative, self- starter	
Professional	with professionalism, work ethic	
Purpose-driven	purposeful, purposefully engaged	
Responsible	with judgment, with discretion, rectitude	
Responsive	Respectful	
Self-directed	self-motivated	

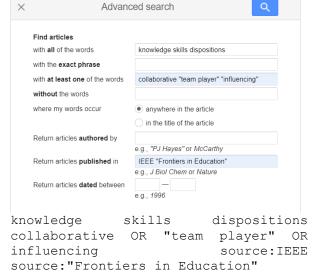

Figure 2. Example user interface and Google Scholar syntax for K-S-D query for *collaborative*.

To help faculty, administrators, and professionals make sense of so many key dispositions, the IS 2020 report authors group them into the six competency realms shown in Figure 3. Since each competency names three key dispositions, Figure shows 534 in total (the numbers in 3 For example, parentheses). Systems Development (in yellow) specifies that a subset of the 11 dispositions in Table 2 are "key" for the 64 competencies within this competency realm. Hence, Systems Development explicitly requires 192 key dispositions, in aggregate, because each of these competencies includes three key dispositions. These dispositions, when tallied, appear in the proportions shown in Figure 4. A further elaboration in the Software Systems Development realm is shown in Figure 5.

Figure 3. Example user interface and Google Scholar syntax for K-S-A query for *collaborative*.

Note that Figure 6 shows that the report suggests that being purpose-driven, meticulous, inventive, and self-directed are most important when learning and practicing the competencies within Systems Development.

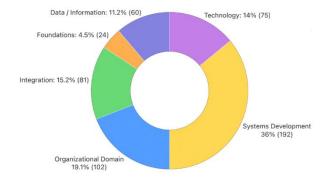

Figure 4. Distribution of key dispositions among six IS 2020 competency realms.

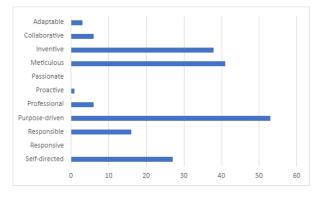

Figure 5. Distribution of key dispositions within the IS 2020 Systems Development competency realm.

Figure 6 shows the distribution of the 11 CC 2020 dispositions across all six competency realms in Figure 3. For IS as a whole, as envisioned by Leidig and Salmela et al. (2020), the most important key dispositions (in decreasing frequency of occurrence on pp. 95-182) are being purpose-driven, self-directed, meticulous, and inventive. The remaining seven dispositions occur between 51 times (professional) and one time (passionate).

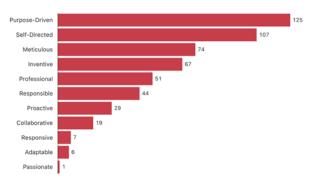

Figure 6. Aggregate distribution of key dispositions across all six IS 2020 competency realms.

5. The Challenge of Disposition in Competency Specification

[CC2020] offers a list of eleven prospective dispositions derived from the literature to round out the knowledge, skills, dispositions as components of competency. Disposition as an intrinsic component of competency represents the opportunity [for the competency author] to clearly express institutional and programmatic values expected in a graduate's work. Dispositional expectations enrich the description/assessment of competency and/or the related pedagogy. Ascribing a disposition to a competency indicates a clear commitment to selfreflection and a sober examination of mission, goals, and objectives to reach the clarity that enables its effective integration in curriculum design, the agency of pedagogy, and the character of professionalism. [CC2020 p134]

Indeed, the CC2020 competency model offers an enhanced and enlightened framework to detail technical expertise but also, a purposeful intension of professionalism to serve society. The transliteration of the knowledge-centric aspects of past, traditional curricular descriptions is less fraught with challenge than the reflective process of discernment and specification of professional conduct and character in the medium of dispositions. It is the latter that we wish to explore in this discourse.

Mindset Dimension – In cognitive psychology a mindset represents the cognitive processes activated in response to a given task. (French & Chang, 2016) In decision theory and general systems theory, a mindset is a set of assumptions, methods, or notions held by one or more people or groups of people. (Cambridge English Dictionary)

In the adapted quotations that follow, the design theorist refers to *mindset* as "appreciative system" and *practitioner* as "stakeholder." (Waguespack, 2019, p. 27).

A [practitioner]'s [mindset] cues what facts to attend to in any particular experience while that same experience results in a learning effect that informs, reinforces and refines the [practitioner]'s apprehension of value and significance, thus altering that [mindset].

[A... mindset] is a complex and emergent agency of choice in [practitioner] behavior situated in a social context. [Practitioners] possess [mindsets] individually as their experience and judgements are personal. In a community of [practitioners] there are recurrent threads of experience, shared knowledge, and commonly held norms that proceed from culture: social, professional, religious, or intellectual. A culture commonly promulgates a standard of appreciation that facilitates a shared cooperation and collaborative decision-making that reinforces community intentionally or unintentionally. Formal education, professional training, and certification, as well as, religious communities, all purposefully foster aspects of shared culture to shape community identity, goals, and expectations of behavior. Shared culture is a basic defining aspect of any community - formal or informal. Any human conception of satisfaction is founded upon [a mindset] that is subject in part to the subjective interpretation of norms and aspirations individual and cultural metaphors.

Figures 7, 8, and 9 use mindmaps to extend the juxtaposition of the mindset dimension of the disposition with both the competency and the competency's task environment and context.

Figure 7. Mindset Dimension of Professionalism

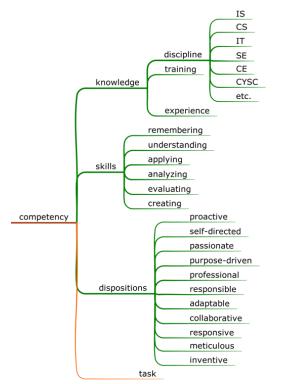

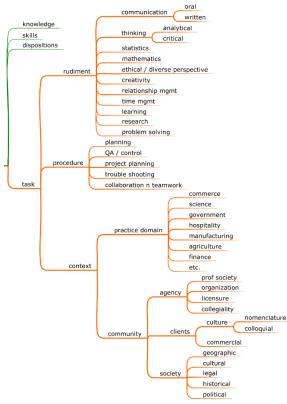

Figure 8. Competency Dimension

6. The Reward in Disposition in Competency Specification

We argue that disposition specification provides a semiotic reflection that enables and activates the greatest promise of the consistency of a competency's availability and activation. As such, we present that the greatest opportunity in the competency model is the degree to which captured and imbued dispositions, forged in praxis, produces the behavior and outcomes. The connection between behavior and outcomes is framed by tasks and performance outcome expectations. The proof of a competency lies within resides within the expected outcomes, artifacts, and action inherent in the competency. Tie afforded to dispositions may well result in greater connection to the expected outcomes that the task environment desires.

To bolster this assertion, we take the position that Information Systems is inherently a design discipline where the appreciative system of the satisfaction of the "clients" of design requires an exauisite balance between feasibility and efficiency that demands dispositional maturity and acuity. As a designer, the IS professional, shaped by the performance expectations and responsibilities of competency, seeks а symmetric balance of quality and technical choice properties in a designed artifact. Dispositions, even the nascent list offered in the CC2020 report, provide the IS professional with an opportunity to balance motive and opportunity; to bridge the natural and artificial realms, and to explore and cultivate notions of satisfaction. This balance, perhaps the art of satisficing becomes necessary when available models of satisfaction are emergent and incomplete, thus full client satisfaction is fleeting.

To satisfice is to recognize tradeoffs and engage in the design of generative metaphor. This ability to "critically think" is to proffer design actions in the face of uncertainty. McGilcrist (2019) and Lakoff (1993) suggest that to design amidst uncertainty is to engage in pattern recognition that is only possible via reference metaphors. A word/concept will anchor the possible moves from one frame of reference for future possible design Fred Brooks (1995) suggests that choices. metaphor maps similar and dissimilar contexts and separates essences and accidents. These are the skills that bring robustness (does it endure in its construction and withstand change?) and vitality (does it continue to thrive?) to the IS professional's designs and the necessarv grounding for these competencies lies within dispositions.

To do so is to embrace, as a regular practice, the esoteric. The discipline and habit to do so is a dispositive challenge for the design of a competency-based curriculum. Dispositions hold the key to long-term development and mastery, in praxis, of the metaphor, technical rationality, appreciative systems, and mastery medium of construction required for robustness and vitality as a professional.

7. Dispositions are Vital for Becoming

We have sought that the reader would consider disposition as a potential lynchpin, cornerstone, and pitfall of competency authoring. The greatest potential for dispositions would be in their ability to sustain and carry the knowledge and skills dimension of the competency model forward. We examine this premise with an extrapolation of the work of Scanlon (2011) on the subject of becoming as it relates to professionalizing. As professionalizing is a process that is fueld from a synthesis of the components of a competency knowledge, skills, and disposition - over time and through experience, Scanlon's work on professionalizing may provide further insight. Scanlon (2011) articulates an archetypal model of a professional as having a body of knowledge based on abstract concepts and theories and requiring the exercise of considerable discretion, an occupationally controlled division of labor, credentialing procedures, training programs and an ethic encourages doing good rather than economic gain. To elaborate, Scanlon (2011) advocates that a professional's high social esteem is based on the provision of expert services from a position of power, trust, and discretion. Furthermore, it is proposed that professionals have fiduciary responsibilities to advance client well-being and to take responsibility for the governance and regulation of activities of their profession. Finally, Scanlon (2011) suggests that engagement in lifelong learning to better serve client needs is an essential aspect of maintain fidelity and trust. While professionalism of this sort is not yet fully, if not even nascently, realized in computing disciplines, the paths that lead to these vital aspects of professionalizing are dispositive in their essence. Thus, the maturity arc of "becoming" for computing must embrace the dispositive dimension that goes beyond technical rationality 1983). (Schön, The "becoming" that Scanlon (2011) describes appears to comport well with the possibilities and opportunities available when explicit focus is afforded to dispositions in a competency specification and competency-based а curriculum.

This paper has attempted to clarify that the dispositive dimension is the matter most important to the successful use of a competency based curricular approach to the IS curriculum design. One argument for this being the case is that dispositions are the newest and most untested element of the competency model. As such, the means for designing curricula for this, as well as measurement approaches to monitor continuous improvement, may be less developed. Here we have articulated a concern, given the fundamentally esoteric nature of the dispositive dimension, that the true promise of dispositions may be overlooked in the development of competency-based computing curricula. We have not taken a prescriptive approach here where best practices are articulated and tested strategies are sold. Rather, what we have attempted here is advocate for extra care, further study, and cautious focus on the novelty of dispositions given the history of computing curricula reports and models. It is possible that embracing further study and comprehension of dispositions can lead to much-needed institutionalization of professionalism and development (Berger and Luckmann, 1867; Schutz, 1962) of the Information Systems discipline itself. As such, we offer that our ability to successfully develop a competency-based approach to Information Systems curricula lies perhaps more with our ability to instill key orientations, behaviors, and instincts in our students about the nature of computing, than the technologies and tools that facilitate our designs and solutions. It is likely that the positive orientations of dispositions will outlast the ebb and flow of technologies; such is the promise we see in the use of dispositions to nurture the "becoming" for our students.

Table 3. Publications that mention disposition (or attitude), knowledge, and skills in four outlets.

Appendix A — CC2020	Prospective Dispositions
---------------------	--------------------------

Disposition	Elaboration
D-1 Proactive	With Initiative / Self-Starter Shows independence. Ability to assess and start activities independently without needing to be told what to do. Willing to take the lead, not waiting for others to start activities or wait for instructions.
D-2 Self-Directed	Self-motivated / Self-Directed Demonstrates determination to sustain efforts to continue tasks. Direction from others is not required to continue a task toward its desired ends.
D-3 Passionate	With Passion / Conviction Strongly committed to and enthusiastic about the realization of the task or goal. Makes the compelling case for the success and benefits of task, project, team or means of achieving goals.
D-4 Purpose-Driven	Purposefully engaged / Purposefulness Goal-directed, intentionally acting and committed to achieve organizational and project goals. Reflects an attitude towards the organizational goals served by decisions, work or work products. e.g., Business acumen.
D-5 Professional	With Professionalism / Work ethic. Reflecting qualities connected with trained and skilled people: Acting honestly, with integrity, commitment, determination and dedication to what is required to achieve a task.
D-6 Responsible	With Judgement / Discretion / Responsible / Rectitude Reflect on conditions and concerns, then acting according to what is appropriate to the situation. Making responsible assessments and taking actions using professional knowledge, experience, understanding and common sense. E.g., Responsibility, Professional astuteness.
D-7 Adaptable	Adaptable / Flexible / Agile Ability or willingness to adjust approach in response to changing conditions or needs.
D-8 Collaborative	Collaborative / Team Player / Influencing Willingness to work with others; engaging appropriate involvement of other persons and organizations helpful to the task. Striving to be respectful and productive in achieving a common goal.
D-9 Responsive	Responsive / Respectful Reacting quickly and positively. Respecting the timing needs for communication and actions needed to achieve the goals of the work.
D-10 Meticulous	Attentive to Detail Achieves thoroughness and accuracy when accomplishing a task through concern for relevant details.
D-11 Inventive	Exploratory / Inventive Looking beyond simple solutions; Examining alternative ideas and solutions; seeks, produces and integrates appropriate alternative

Appendix B. Google Scholar Search Query Examples for Dispositions

For each of the dispositions in Table 3, we ran Google Scholar queries to count the papers in each of our four publication outlets. For each disposition, we included synonyms and adjacent concepts from Clear & Parrish et al. (2020) and Leidig & Salmela et al. (2020) in the queries. We also distinguished articles that included the term "attitudes" as an alternative to "dispositions." For example, Figure 5 shows the knowledge, skills, and dispositions (K-S-D) query for *collaborative* in IEEE Frontiers in Education. Similarly, Figure 6 shows the knowledge, skills, and attitudes (K-S-A) query for *collaborative* in the Information Systems Education Journal. Finally, Table 2 lists the dispositions, synonyms, and adjacent concepts used in these 88 queries.

Appendix C. Word Cloud Visualizations for Unique Article Titles
